Title project: Gaze Behavior in Collaborations: Japanese vs Dutch

The present research investigates culture-specific patterns of gaze behavior of Japanese and Dutch participants in collaborative tasks and reveals the effect of making eye contact on their task performance. Previous research has shown that making eye contact reduces uncertainty about others' behavior; thereby, facilitating successful cooperation. Culturally learned display rules influence how individuals engage in gaze behavior. Some research show individuals from East Asia engage less in eye contact compared to North Americans (e.g., Hasler & Friedman, 2012). However, previous work has shown mixed results about the notion of gaze avoidance in East Asians. Twenty university students with either Dutch or Japanese backgrounds participated in this study. A pair of participants from the same cultural background played puzzle copying tasks together. Eye-tracking glasses are used to record their eye movements. Indeed, the results of eye-tracking data revealed Japanese participants spend less time making eye contact in comparison to Dutch participants. Additionally, mutual gaze between a pair of participants had positive impacts on their task performance. This research highlights the importance of eye gaze and its impact on fluency in coordinating joint actions. This research provided empirical evidence on cultural differences in the use of gaze behavior.

Note: I am not done with my experiments so the results I mentioned in this abstract are written for the sake of this assignment.

Title project: Motivation and reward in a social media environment

Craicter is a reward based social media platform, a business at its beginning, which aims to combat the negative effects of social media through rewarding participants for their productive behavior. To assure a better understanding of user's behavior, a round of questionnaire was carried out. Firstly, to identify their motivating factors in relation to social media activity. Secondly, to understand what kind of rewards will be more appealing and will motivate them more to interact with the app and get involved in social productive behavior. For a better understanding of the variables that could influence people's behavior, the questionnaires were adapted for two categories of users: the ones which were already used with the company's activity, as well as for those who did not interact before with Craicter's purpose. Age and demographic area were also considered.

Through this survey, extrinsic motivation and real-life activities related rewards were correlated with a high frequency of social media usage. At the same time, the high level of social media activity was positively correlated with the predisposition to get involved in rewarding or challenging activities.

Key words: motivation, rewards, social media.

Title project: “FunnelFlow: software pilot testing with a client”

Recently, the software FunnelFlow for wireframe and usability testing was released by the innovation department of Validators, which will be marketed as Software as a Service (SaaS) in the future. The internship objective was to recruit a client for a software pilot test by addressing hands-on research objectives. The client study report is to be used conversely to exemplify the application possibilities and unique selling points of FunnelFlow to convince potential customers. For the client Renoon, a meta search platform for sustainable fashion, FunnelFlow was used to investigate the brand concept perception and the product search experience on Renoon's website. For the study, N = 75 female participants were recruited. Analysis of the results with FunnelFlow provided insights into the customer experience and recommendations for the client were derived. Diverse application possibilities of FunnelFlow were shown in the pilot test, however further points in need of improvement were revealed.

Title project: Travel Experience and Activities during Commuting using Ride-hailing: Ride-hailing Services in Bantul, Sleman, and Yogyakarta, Indonesia.

This research aims to explain people's behavior during their journey using ride-hailing services. The vast growth of ride-hailing services in Indonesia has made its services a part of people's lives. The previous research focused on the intention of using ride-hailing services; this research will focus on users' journey experience in relation to the type of activity they did during the journey. Using a quantitative methodology, a discrete choice approach was selected to see users' activity during their trip and likert scale to understand their journey experience. This research targeted people over 18 years old who live within three cities of Special Region of Yogyakarta – Bantul, Sleman, and Yogyakarta. From a total of 2000 responses, leads to the results that the most of respondents were having a good travel experience and spent their time in conversation with the driver or other guest during their last trip. In the development of technology, human interaction is still taking a big part in the effort to create a good experience for the users. This study can remind ride-hailing providers

not only to put forward technology development but also to see the importance of human touch for a better users' experience.

Key words: ride-hailing, travel, experience, Gojek

Title project: Running towards new improvements for immunotherapy: a literature review

This literature review aims to identify two potential strategies to help improve immunotherapy. In recent years a new treatment for cancer patients was introduced called immunotherapy. This treatment focuses on fighting cancer cells via the immune system. The most commonly used type of immunotherapy is immune checkpoint blockade. This therapy regulates the activity of a type of immune cells, called T cells, allowing those T cells to kill cancer cells. Nonetheless, immunotherapy is not perfect and can lead to adverse side effects such as pneumonitis and hepatitis. Furthermore, immunotherapy does not work for every patient and is not FDA-approved for every type of cancer. Two potential behavioral strategies that can help ameliorate immunotherapy are exercise and classical conditioning. We identified six studies that used the combination of exercise and immunotherapy and seven studies that used classical conditioning in the context of oncology. The results show the possibility of these two strategies in ameliorating immunotherapy.

Title project: "What are the needs of patients": A literature Review on digital rehabilitation for visual impairment

Objective: This study aims to find out the current state of knowledge on digital health services worldwide by performing a thorough desk qualitative research and reviewing the past research into the use of eHealth, telemedicine, telerehabilitation, video therapy, and new technology or devices combined with digital health for visual impairments, to find out what the most important points of attention are in this, as well as the factors for satisfied patients for telemedicine and eHealth services, compare with that of the traditional in-person therapy.

Method: Searching keywords includes Ehealth; Online care; Video care; Head-mounted displays; Telehealth; Telemedicine; Tele-rehabilitation; Teleophthalmology; Satisfactions of

telerehabilitation and all these above about visual impairment, low vision, and its rehabilitation. The target group includes children, youths, adults and the elder, and all those above who are already diagnosed as visually impaired. This study reviewed 126 published articles from 2019 into 2022 in 8 databases (google scholar; Scopus; Science Direct; Web of science; ACM Digital Library; IEEE Xplore Digital Library; Psyc info and Philosopher index), there are 17 studies left after being excluded irrelevant articles based on the exclusion and inclusion criteria.

Result: Recent development in Low vision enhancement and personalized telerehabilitation using Head-mounted low vision aid and devices combined with video display systems was found effective for visual rehabilitation. Telemedicine was equally effective as in-clinic visits at identifying progression in the glaucomatous disease. Digital technology like telemedicine combined with the use of Virtual Reality (VR), Augmented reality (AR) and Artificial Intelligent (AI) in ophthalmology are also effective in improving visual functions.

Title project: The Strong Experiment Tools of the Era of the Internet—Gorilla VS PsychoPy

With the development of the internet and the occurrence of Covid-19, more and more psychological researchers intend to use online experiment platforms as their newest experiment tools. Nowadays, there has been some researches in terms of online tools using diverse methods and comparisons. Still, it remains unclear how well the burgeoning experimental platform Gorilla performs relative to standard laboratory software—PsychoPy on accuracy and precision. This study separately replicated classical experiment attentional blink using Gorilla and PsychoPy to test their performance. The result demonstrated that the presentation time of Gorilla is more accurate than PsychoPy. However, we found no noticeable difference in the precision related to platforms. We concluded that no single platform performs well in accuracy and precision concurrently, and Gorilla, as well as PsychoPy, are both excellent platforms in behavior research.

Title project: Predictors of Perceived Annoyance of Medical Alarms in Intensive Care Units: A Literature Review and Study Protocol

Although critical care nurses often experience high levels of annoyance attributed to medical alarms, there is a lack of published data on the predictors for alarm annoyance in the intensive care units (ICUs). This project aimed at investigating the predictor variables

that may explain the annoyance from medical alarms in the ICUs. We conducted a literature review to 1) recognize the underlying cognitive processing of perceived alarm annoyance, and 2) identify the potential predictors of perceived alarm annoyance. Then we proposed a study protocol to verify the explored predictors. We anticipate the result of this study will enable both healthcare policymakers and alarm designers to better recognize the factors that may lead to alarm annoyance and thereby move towards more effective solutions to improve the soundspace of ICUs.

Title project: testing the coherence of association words with their respective constructs

Implicit association tests are one of the most used measures in psychology, but the accompanying association words are not always kept up to date. Bloakes, a Dutch marketing research company, wants to investigate if their association sets can be improved, because they have never been properly scrutinized. The aim is to test to what extent the association words cohere with the respective constructs. If some association words could be better filtered and more fitting within their constructs, this could result in more accurate testing and results. This is measured by using a binary choice task in which participants choose which word they find most fitting within a specific construct. There are no results yet, but

based on literature research, it is hypothesized that participants will have a preference for more familiar words.

Title project: A Multipurpose Space Innovation: Investigating the user Experience of the MEGG prototype I.

The 'MEGG', is an egg-like curvilinear and closeable cabin in which people can stand and sit. The MEGG has no predefined purpose and is therefore called a multi-purpose space. In the current study, the user experience of MEGG prototype I was tested. Participants used the MEGG and an interview was held afterward. Questions were asked about the following aspects: general impression, space perception, time use, user experience, comfort level, the chair, mood dynamics, temperature, sound (permeability), the potential of openings in the MEGG, and willingness to pay. Moreover, participants were asked about their suggestions for improvements. The results show that there are similarities as well as differences between the answers of the participants. For each question, a summary of the answers is made. Since there are many divergent questions and answers, there is not one specific conclusion to make about the user experience. The results can rather be interpreted in terms of positive and critical comments. They can be used as guidance for considerations in further developments of the MEGG.

Title project: How self-serving is the self-service that User Sense offers?

User Sense is a Dutch agency that offers qualitative user experience research to test sites, apps or prototypes. Their services are offered as a full package, where the research is completely carried out by User Sense, as well as their tooling per se. The latter allows clients to independently carry out usability research, using User Sense's software and participants. Unfortunately the 'self-service' is hardly being used by clients. Since up until this point the dashboard has not been subjected to usability research, it is important to investigate whether the current situation could be (partly) explained due to usability issues on the dashboard, which deters clients from independently carry out usability tests. In this presentation I will explain the outcomes of this project as well as the general procedures that are involved with usability testing at User Sense.

Title project: Requirements for Remote Operations

Advanced digitalisation and automation in (safety-critical) operations have enabled operators to get a more passive and remote role. Remote operators oversee operations from a remote control centre (RCC), from where they receive information of the current and future situation and are kept in the loop for accurate final decision making and action. How human operators perceive this information is dependent on the human's and system's characteristics, the organisation and the directness of sensory information. In this study, the defined human factors in the operation process are determinants for the requirements of operators and the design of their (functional) automated environment. In this study, novel requirements for the operator, the Human Machine Interface (HMI) and the workplace are presented to guide entire, human-centred, remote operation designs for the future. This study was performed for Automated Train Operations (ATO), but can be generalised towards other automated, remote, and safety-critical operations.

Title project: Lockdown has lasting effects on Gen Z and Millennials

This research at MediaTest was focused on the effects of the first intelligent lockdown on Gen Z regarding FOMO and how these differed from millennials. Spending habits and social media use were also looked at. This was done as Gen Z is often associated with FOMO and this has destructive effects on physical and mental health. Because the social restrictions during the lockdown applied to everyone, FOMO may have been experienced less during this time. This study was therefore conducted to investigate if they experienced less FOMO after the lockdown, as this could result in an improvement of physical and mental health. A quantitative study was conducted through an online survey (N = 162). They were asked questions about FOMO, social media use and their spending habits during and after the lockdown. Lasting effects of the lockdown on these categories were found.

Title project: Consumer Insights: Games and Esports

Newzoo is market insights and analytics company focused on games market data and consumer insights. As a research analyst intern, I partake in the syndicated study called Consumer Insights: Games and Esports, which aims to provide a better understanding of the gamer profile, motivations, and behavior. My internship deliverable aims to answer: "How do research analysts go about setting up an annual multi-country quantitative study in 36 markets?" Additionally, I explain how such data is useful for leveraging insights for companies in the gaming industry. For this, three main conclusions were made and explained; (1) drafting the survey requires deliberate literature research (e.g., brand availability in various markets) to collect accurate data, (2) having different stages during preparation, from content research to survey-testing, ensures that the final product offers good-quality insights, and (3) considering earlier responses in the making of the new survey assures that up-to-date questions are asked.

Title project: Let's explore digital accessibility!

Nowadays, the great design challenge is to incorporate accessibility in a design process from the start, to make the web available to an increasingly diverse audience. Daily Creations is a small and growing UX agency, that has not yet optimally embedded accessibility into their organization and designs. The purpose of this project is to explore how to incorporate accessibility in Daily Creations' organization by creating awareness and focusing on shaping a clearer picture of the current messy and complex WCAG guidelines that describe success criteria for accessible websites. First, interviews were conducted. Subsequently, the research design consisted of two main steps: (1) building a digital accessibility WCAG checklist for Daily Creations for internal use, and (2) analysing DC's website to improve accessibility in their design, following the WCAG evaluation method. The findings show that Daily Creations can improve their website on accessibility, and that the WCAG guidelines can be a useful tool in their design process to reflect on their projects with as a consequence striving towards allowing everyone, including the disabled, full access to digital web content.

Title project: Internship projects at Neurolytics: a literature study of Neurolytics' questionnaires, and objectiveness and reliability analysis of the engagement detection model

My internship consisted of two projects. The first project was an overview of the reliability and validity of the questionnaires that Neurolytics use to train their computer vision models. We found that the questionnaires have good psychometric properties. For the second project we conducted an experiment to investigate the reliability of the engagement detection model. This model select the right candidates for a company's culture in an objective way and gives engagement scores. In the second project 13 participants participated in an experiment with two types of manipulations. In the emotional faking manipulation we looked into the effect of faking emotions on the engagement scores. For the appearance manipulation we looked into the effect of changing the physical appearance on the engagement scores. The results showed a significant effect of the condition happy and for the appearance conditions, the results showed no significant effect.

Title project: Creating Podcasts and Sound Logos to Enhance Brand Expansion

The use of sound in advertisement and brand expansion has become more and more popular in recent years. There are many advantages to it such as better brand awareness and increasing customer loyalty. The two objectives of this paper were to create a podcast format for the company's reports and to design a sound logo that the company's values and identity represent. Based on literature research, a set of guidelines has been composed a podcast should comply with. In the same way a set has been composed that a sound logo must meet to be effective. Based on those guidelines a podcast format, two podcasts and two sound logo prototypes were created.

Title project: ??

This report outlines the duties of a three month internship at Braingineers, a company that analyzes user experience through EEG, eye-tracking, click-/touch-tracking and

neurofeedback. This research method is used for capturing the subconscious consumer behaviour.

Throughout this internship, I was mainly occupied with recruitment of participants, preparation of the apparatus, instructing participants, running the experiments, neurofeedback interviews, & preparing data for analysis.

For my individual project, I conducted usability research on a commercial video for McDonalds. This research is currently used by Braingineers as a demonstration for potential clients, as the projects they conduct for clients are private and thus cannot be used as demonstrations.

The most notable result from the analysis shows that people think that the brand does not match the video, although the chosen TVC associations do match with McDonalds' brand values. This implies that the general brand associations do not correspond with McDonalds' own values.

Title project: Is that a smile?: The relationship between emotional availability and facial emotion recognition

The ability to process different facial emotions develops early in life. The development of this ability is influenced by outside factors. One possible factor is emotional availability which is a measure that scores the quality of interaction between parent and child along different dimensions. This quality of interaction might be related to the way facial emotions are processed. This paper investigated if emotional availability relates to processing facial emotions. 56 9-10 month old infants participated in this experiment and were shown pictures of neutral, happy or fearful faces. These faces only contained either high or low spatial frequency information. EEG data of the N290, P400 and Nc which is believed to play a part in this process is collected and are compared for changes based on the emotional availability scores. This paper did not find a difference in emotional facial processing for the emotions and there was no effect of emotional availability. This deviates from other studies and might be explained by a difference in participants.

Title project: Visual communication systems: The use of gestures and digital communication systems in people with dementia

One out of five people develop some form of dementia. As a result, people often experience communication problems. Communication is very important for the quality of life as it enables people to express need, wishes and feelings. The aim of this research is to investigate whether the use of gestures and digital communication systems can be used for people with dementia. There were 8 people participating who were acquired through a snowball effect. This research showed that no general answer can be given to the research question, because of the fact that every person is unique and has different background and preferences. Therefore there is no fixed method that works well, this depends on the characteristics of the person, type and the phase of dementia. In the future, it is important to involve people with dementia in designing new communication tools by listening and looking at them. Also it is important to keep in mind that each person is unique.

Title project: Standing my scientific ground in a non-scientific world.

Mediabirds is a new web design bureau in Amsterdam that offers website development, branding, User Experience as well as website optimisation. My role at Mediabirds was to provide, improve and deepen psychological knowledge used in website developing and branding. The internship at Mediabirds gave me a first introduction to applying my knowledge into a non-scientific branch. This showed me how difficult it can be to narrow knowledge and expertise into approachable and usable results. Where are the boundaries between approachable applicable psychology and incorrect or incomplete psychology? To what extent does certain knowledge even have to be approachable? How do you comply requests in a company with the values of your expertise? While I mainly followed the requests of the company, I struggled with these questions. Therefore, I want to present a reflective analysis substantiated with academic literature, to further explore these questions.

Title project: Improving conversion rate of the Boon Edam Nederland website

In May 2021, revolving door and security barrier manufacturer Boon Edam was introduced with a new design for their corporate website. While many costs were involved in improving their website, the new design had no effect on the website's conversion rate. By doing literature research, a theoretical framework for an effective conversion design is developed. This framework is subsequently used for the design of two A/B tests, comparing the renewed design with one containing several alterations. This comparison considers conversion rate and aspects of user behaviour preceding possible conversion in the near future. This includes visit duration, click-through rate, et cetera. Possible limitations of these tests comprise lower conversion rate in the test version due to unfamiliarity of the web design to returning visitors. The established framework and results from the A/B tests are used for composing a list of recommendations that is introduced to the marketing team of the Boon Edam.

Title project: Analysing the Communication of Search and Rescue Operations at the North Sea. Can new technologies be an useful support?

To have effective search and rescue operations, good communication between operators is necessary. Therefore, the communication between KWC and KNRM was analysed. Additionally, it was investigated whether there are technologies that could support this communication. Interviews of KWC and KNRM were evaluated and analysed with regard to communication processes. Based on these interviews, a task analysis was conducted. Further, possible tools for support were evaluated using previous literature. Results suggest that currently audio-only communication is used by KWC and KNRM. This indicates that merely auditory and verbal social cues are present. Social cues are signals that are important in social interactions and that can be expressed verbally or visually. Supporting technologies should include a shared visual work area to increase shared situational awareness. Another possibility could be extended reality to make communications more natural and to compensate missing visual social cues.

Title project: Claim Substantiation in Sensory Research

As the advertising market grows more prominent, companies want their products to be distinguishable from other products in the market. Products often have claims regarding their various features or messages about the user's experience. These statements can influence sales, and it is crucial to make claims backed up with empirical evidence. If there is insufficient scientific evidence for the statements, the claims might be deemed misleading, and it can have grave consequences for the manufacturer. My main project at Essensor is about this topic, namely Claim Substantiation. It can be defined as the process of proving and showing that the claims about the products are valid and backed up by scientific evidence. I help with data analysis of some of the tests about certain products and assist in revising the design and methods. This project aims to show whether the claims the clients want to make about their products are possible.

Title project: Facilitating the change towards a sustainable society with communication

This internship was done at the department of communication at the Ministry of Economic affairs and Climate, and at the Ministry of Agriculture, Nature and Foodquality. In governmental communication, (as in all forms of communication) behaviour should be incorporated which has not been the default in previous decades. Sending information to a receiver does not automatically mean the receiver will act on this information. Therefore, a different approach might be necessary for each problem, intervention and target group. However, over the last few years, this has become more clear and behaviour is increasingly used in policy and communication. Another interesting development is sustainability becoming more evident on the agenda in policy making. In order to accomolish European and Dutch goals for climate and sustainability, the following problems were addressed in this internship. A transition from a traditional diet to a plant-based diet requires neHAVIOUR change and understanding of resistance and adaptation problems. In the realm of the transition towards a more sustainable business process in SMEs, what behaviour change is necessary and how can the government play a role in this? And since we are transitioning into a digital world with hackers and cybercrime, what behaviour change related to updating devices is necessary and again, how can the government play a role in this? Projects at the government, especially during times of parliament formation take longer than three months. Interim results show that different projects and consumer groups need a different approach. These projects will develop as time passes and more results will follow.

Title project: Brain & Behavior in Organizational Change Management

How does Neurofied, a company that specializes in behavioral psychology and neuroscience, help organizations with Organizational Change Management? How is a subject like Organizational Change Management related with human behavior?

Organizational Change Management is a framework for managing the effect of new business processes and changes within an organization. Neurofied breaks it down into psychological themes, by applying science backed behavioral insights.

I analyzed the definition of OCM and its pillars, past and present knowledge, and the organizational context. I investigated the cognitive biases, and the balance managers must look for. Subsequently, I discussed some future trends, and I answered why Brain & Behavior is key for OCM. I spoke of three approaches Neurofied implements, and a case study. Finally, I talked about Neurofied's deliverable.

The result was to inform the audience that the client should learn to understand how people think, decide, and act and apply behavioral psychology and neuroscience to optimize their business.

Title project: Covid-19 measures and development of emotional face processing.

Emotional face processing is an important factor of social competence, and is mostly developed in the first year of life and finetuned during childhood. Input from the social environment is argued to play a big role in the development of emotional face processing. However, due to closing of e.g. day-cares and reduced visits to prevent spreading of the Covid-19 virus, social input has changed for toddlers and infants. EEG Data from the YOUTH Cohort study is used to investigate the difference in emotional face processing between 10-month-old and 3-year-old children measured before March 2020 and after March 2020. We expect that the children tested after March 2020 show smaller differences in ERP signals between different facial expressions than children tested before that time.

Title project: Craicter, a step towards the international market

Craicter is an Irish rewards-based social platform who give users prizes for posting challenges and fun activities onto the platform or completing them. They want to promote this new monthly subscription revenue model to international market and they care for user's preferences for challenges and prizes as well. In my research, I use the method of literature research to have a basic and clear understanding of three significant topics about international market: social media use, user insight, and competitors. On the basis of absorbing and summarizing the achievements in the previous researches, the Instagram and Facebook are proper platforms for Craicter to gain followers during the Inception phase with women-oriented marketing and advertising strategies. Irish localization is the key to make a solid success before worldwide promotion. Then, we conduct a traditional market survey by a round of questionnaires to collect data to help us understand how people would react to a social media centered around the challenges and prizes to increase the engagement of users. This survey consists two independent parts: one for existing followers on IG, another for people who don't know the platform. Almost 150 respondents from Ireland, Canada, Australia, and other countries were surveyed online or on the streets. Compared with previous study conducted in Ireland, the result has again proved that people are interested in the model where they can get rewards for completing fun challenges regardless of their nationality or gender. Besides, a general pattern does not exist when it comes to prizes that each has their own preferences. Interestingly, there are no distinct differences across countries in every part. In conclusion, the craic model works across internal markets as well as in Ireland and the results give us a good insight of how to set up challenges and prizes for our users.

Title project: The impact Covid-19 has on consumers' behavior

During my internship I started a survey on the change corona virus brought in the field of consumption. The research question was, has the pandemic changed people's lifestyle and preference in buying things or services? More specifically, during my internship in the poll agency called Interview I made questionnaires regarding the consumption of technological equipment and social activities. After I did data analysis, I found out that Covid-19 made people more accustomed to technology which as a result increased the consumption of technological equipment. In addition, due to the lock down people got more used to staying home and not participating a lot in social activities.

Title project: Attributions towards Mixed Reality application

Koji's Quest is a Virtual Reality game that is developed by NEUROoreality and is currently being assessed for application in cognitive rehabilitation in collaboration with SMARTneurolab - a research group at Utrecht University. Koji's Quest is a Virtual Reality game that combines neuroscientific insights, gamification and trains cognitive functions such as decision making, multitasking, long, short and working memory training etc. Being a part of the research group for my internship I focus on a couple of projects related to the investigation of the game as well as challenges that may arise in the adaptation process of new technology.

In order to investigate technology adaptation topics, attributions towards Mixed Reality of health specialists in the Netherlands will be assessed by 20 items questionnaire measuring: perceived usefulness of the tool, intention of use and general understanding and experience with Mixed Reality. The main objective for the second project is to conduct experimental research with the Virtual Reality game Koji's Quest to evaluate the changes in attribution towards game application for cognitive skills training.

Title project: From optimizing a website to optimizing a web shop: additional questions to consider during the optimization process

Abstract: As part of my internship at SYcommerce, I have been tasked with adapting a spreadsheet regarding the web scan of websites in such a way that it would be applicable to web shops. The problem for SYcommerce was that the web scan could not be used well for the optimization of web shops. The problems I had was that I didn't know much about marketing, especially in combination with Applied Cognitive Psychology, and that I wasn't confident enough in my skillset in a commercial setting. With this project, all those problems could be tackled. The way I updated the spreadsheet was by adding, altering, and removing questions, based on literature. As such, I hope to have provided a good start on which can be built in the future to complete the web shop web scan, and to have reached the goal SYcommerce had. I have certainly reached my own goals.
